

1 **Response to Associate Editor and Referees**

2  
3 Manuscript Title: **Macroalgal influence on particulate organic matter sources and**  
4 **early transformation in an Arctic fjord**

5  
6 Authors: Ashok Shivaji Jagtap et al.

7  
8 Dear Dr. Yuan Shen and referees,

9  
10 We sincerely thank the Associate Editor and referees for their positive, constructive,  
11 and thorough evaluation of our manuscript. We greatly appreciate the recognition of  
12 our study's novelty, particularly the comprehensive multi-proxy approach integrating  
13 bulk elemental and stable isotopes, biopolymeric fractions, and molecular biomarkers  
14 (amino acids and monosaccharides) to elucidate how expanding Arctic macroalgal  
15 beds act as dynamic biogeochemical hotspots that laterally export and restructure  
16 pelagic particulate organic matter.

17 In accordance with the referees' and editor's suggestions, we have carefully  
18 revised the manuscript to improve clarity, strengthen interpretations, and address all  
19 specific comments in detail. We believe these revisions have substantially improved  
20 the quality and readability of the manuscript. Below is our detailed, point-by-point  
21 response to all comments raised during the interactive peer-review process, with line  
22 numbers referencing the revised manuscript.

23  
24  
25  
26 **Response to Referee 1 comments (RC1)**

27  
28 This manuscript investigates the influence of macroalgal beds in the Arctic  
29 Kongsfjorden on the sources and early transformation processes of surface particulate  
30 organic matter. By comparing surface water samples from four macroalgae-dominated  
31 sites and their adjacent waters (500 m and 1500 m), and employing a combination of  
32 elemental analysis, stable isotopes, macromolecular composition, and molecular  
33 biomarkers, the authors found that macroalgal beds are a significant source of labile  
34 carbon and nitrogen compounds in surface POM, with their molecular fingerprints  
35 (e.g., monosaccharide and amino acid composition) showing distinct signatures. POM  
36 derived from macroalgae can be exported to the fjord scale and undergoes selective  
37 transformation during lateral transport. Principal component analysis revealed a  
38 continuous biogeochemical gradient from the macroalgal beds to the adjacent waters.  
39 Among the sites, Brandal stands out as a distinct biogeochemical hotspot influenced  
40 by macroalgae. This study provides important multi-proxy evidence for understanding  
41 how expanding macroalgal communities, under rapid Arctic warming, influence the  
42 sources, transport, and transformation of coastal organic carbon through benthic-  
43 pelagic coupling processes. It holds clear academic value for deepening the  
44 understanding of the Arctic coastal carbon cycle and is worthy of publication after  
45 revision.

46 **Response:** We sincerely thank the referees for the positive and constructive  
47 evaluation of our manuscript. We greatly appreciate the referee's recognition of the  
48 novelty and multiproxy approach in elucidating the influence of Arctic macroalgal

49 beds on the sources, transport, and transformation of POM in Kongsfjorden. We  
50 appreciate the referee's acknowledgement of the importance of biochemical and  
51 molecular-level analysis, including elemental composition, stable isotopes, amino  
52 acids, sugars, and multivariate approaches, in identifying macroalgal-derived  
53 signatures and biogeochemical gradients from coastal beds to adjacent fjord waters.  
54 Following the referee's suggestions, we have carefully revised the manuscript to  
55 improve clarity, strengthen interpretations, and address all specific comments in detail.  
56 We believe these revisions have substantially improved the quality and readability of  
57 the manuscript.

58

## 59 Major Deficiencies and Revision Suggestions

60 1) The abstract and highlights sections are repetitive and could be further refined.  
61 (Lines 14-22, 24-45). It is suggested that the author revisits and integrates the  
62 content of these two sections. Consider refining the "Highlights" into the most  
63 concise and eye-catching core innovative findings, while the "Abstract" should  
64 maintain its independence, providing a complete yet succinct overview of the  
65 research background, methods, main results, and conclusions, avoiding simple  
66 repetition of the highlight statements.

67 **Response:** We thank the referee for this helpful comment. We have revised the  
68 abstract (Lines 34-40) to provide a complete overview of the research background,  
69 methods, main results, and conclusions. The highlights (Lines 14-19) have been  
70 revised to focus on core innovative findings in a concise manner, without repetition,  
71 and incorporated into the revised manuscript.

72

73 2) Lines 511-536: The explanation for the mechanism behind the finding that  
74 "Brandal is a biogeochemical hotspot influenced by macroalgae" is primarily  
75 attributed to "high biomass," "favorable growth conditions," and "possible promotion  
76 of detritus retention by hydrological conditions," which is somewhat general. It is  
77 suggested to add a subsection or paragraph to explore more specifically the potential  
78 local driving factors that make the Brandal site a hotspot. For example, can known  
79 information about the site's geographical location, water depth, hydrodynamic  
80 characteristics (e.g., whether it is in a circulation or upwelling area), degree of  
81 freshwater input, etc., or citations of relevant literature, be incorporated to support the  
82 speculation that "hydrological conditions promote retention," making the conclusion  
83 more robust.

84 **Response:** Thank you for the suggestions. We have revised Section 4.4 (Lines 540-  
85 558), expanding our discussion of local driving factors at Brandal in the revised  
86 manuscript.

87

88 3) Specific citation suggestions:

89 1) Lines 89-91: In the introduction, when discussing the complexity of organic matter  
90 sources in the Arctic coastal zone, after ".....(Singh et al., 2024b) and sediments (Roy  
91 et al., 2025) in Kongsfjorden", add: "Similarly, studies on the Qinghai-Tibetan  
92 Plateau saline lakes have shown that the molecular composition of dissolved organic  
93 matter is also strongly influenced by watershed inputs and internal biological  
94 processes (Jiang et al., 2022), and that terrestrially derived organic matter can be  
95 transformed driven by aquatic microbial communities (Yang et al., 2020)."

96 **Response:** We thank the referee for this suggestion. We have incorporated the  
97 relevant citations (Line 93-97) into the introduction in the revised manuscript.

98

99 2) Line 457: After "observed decline in POC from MDS to Adj-W", insert: "This  
100 aligns with the classical understanding of preferential degradation of labile  
101 components in marine environments. In lake sediment systems, inputs of algal and  
102 terrestrial organic matter have been shown to stimulate significantly different  
103 microbial degradation processes (priming effects) (Yang et al., 2023), with  
104 methanogenesis potentially dominating the carbon flow under anoxic conditions  
105 (Yang et al., 2025), implying the key control of organic matter molecular  
106 composition on its transformation pathways."

107 **Response:** We thank the referee for the suggestion. We have incorporated the  
108 relevant citations in the revised manuscript.

109

110 3) Line 517: After "matter within this macroalgal-dominated habitat", insert: "Habitat  
111 heterogeneity is considered a primary factor driving microbial community assembly  
112 and functional differentiation in extreme environments (Huang et al., 2026). In  
113 Qinghai Lake, the assembly mechanisms of prokaryotic and microeukaryotic  
114 communities have been shown to be significantly different and regulated by different  
115 environmental factors (Han et al., 2023). Similarly, research in the Aral Sea region  
116 indicates that minor differences in salinity and mineralogy can lead to distinctly  
117 different responses in microbial and endophytic communities (Jiang et al., 2021).  
118 Therefore, the Brandal hotspot may result from the combined action of its unique  
119 substrate (macroalgal bed), local hydrodynamics (forming a 'retention zone'), and the  
120 resulting unique microbial community, reflecting the high specificity of  
121 biogeochemical processes at the microhabitat scale."

122 **Response:** We thank the referee for this insightful suggestion. We have integrated the  
123 relevant citations in the revised manuscript.

124

125

126

127

128

129

130

131 **Response to Referee 2 comments (RC2)**

132

133 Overall, this is a strong and timely study that applies a comprehensive multi-proxy  
134 approach to explore macroalgal influences on particulate organic matter dynamics in  
135 an Arctic fjord. The dataset is robust and the analyses are generally well interpreted,  
136 providing valuable insight into benthic–pelagic coupling in a rapidly changing Arctic  
137 coastal system. A number of revisions would further strengthen the manuscript,  
138 particularly improvements to figure clarity and accessibility, minor typographical and  
139 formatting corrections, and additional detail in the statistical methods to improve  
140 transparency and reproducibility. The manuscript would also benefit from some  
141 streamlining of lengthy results sections and clearer structuring of the discussion,  
142 including a brief synthesis of key findings and a slightly stronger emphasis on broader  
143 implications. Addressing these points would enhance readability and ensure the  
144 study’s contributions are fully accessible to a wide readership.

145 **Reply:** We sincerely thank the reviewer for the positive and thoughtful evaluation of  
146 our manuscript. We greatly appreciate the reviewers' recognition of the novelty and  
147 comprehensive multi-proxy approach of this study, as well as its contribution to  
148 understanding particulate organic matter dynamics in Arctic coastal systems  
149 undergoing rapid environmental change. We also appreciate the reviewers’  
150 constructive suggestions for improving the manuscript. In response, we have carefully  
151 revised the figures to improve clarity, readability, and accessibility, and corrected the  
152 identified typographical errors throughout the manuscript. Additional details on  
153 statistical analysis have been included to enhance transparency and reproducibility.  
154 We have also streamlined the Results section to improve flow and readability, and  
155 reorganized the Discussion section to provide a clearer thematic structure, stronger  
156 synthesis of the main findings, and broader contextual implications for Arctic coastal  
157 carbon cycling under climate warming. We believe these revisions have substantially  
158 strengthened the manuscript and improved its accessibility to a wider readership.

159

160 **General typos and suggestions for clarification**

161 Line 26 This study investigates

162 **Reply:** Thank you for pointing out the grammatical error; we have corrected it (Line  
163 26) in the revised manuscript.

164

165 Lines 67 – 70 not needed, can remove

166 **Reply:** Thank you for the suggestion. As suggested, the statement has been removed  
167 in the revised manuscript.

168

169 Lines 71 – 73, how are the macroalgal beds lost? Provide an example of the process /  
170 reasons for these losses.

171 **Reply:** Thank you for the comment. To clarify, the focus of lines 70–74 is specifically  
172 on **macroalgal blade erosion and fragmentation** rather than the loss of the entire  
173 macroalgal bed. This distinction is important because blade erosion represents a  
174 continuous, daily contribution of organic material to the Particulate Organic Carbon  
175 (POC) pool, even while the macroalgal bed remains intact. For clarity, the process of

176 macroalgal blade erosion is provided, which is mainly driven by mechanical stress,  
177 physical abrasion against rocky substrates, seasonal increases in tissue brittleness, and  
178 biological weakening by epiphytes. All of these facilitate the gradual fragmentation of  
179 the blade into the particulate organic matter pool.

180

181 Figure 1 – Consider adding place names and enlarge latitude/longitude text.

182 **Reply:** Thank you for the suggestion. As suggested, the place names were added in  
183 Figure 1, and the font size of the latitude and longitude text was increased for better  
184 visibility.

185

186 Section 2.7 Statistical analysis – what packages did you use in R for your statistical  
187 analysis? Did you test for equal variance and normality assumptions before  
188 proceeding to ANOVA?

189 **Reply:** We have updated Section 2.7 statistical analysis in the revised manuscript  
190 (Line 197 - 202).

191

192 Tabel 1 – if you're abbreviating, include the abbreviation in brackets in your table  
193 caption (e.g. sal for salinity).

194 **Reply:** Thank you for pointing out that we have updated the abbreviation in the  
195 revised manuscript (Table 1).

196

197 Figure 2 – this is very hard to read, consider enlarging and making all text bigger

198 **Reply:** Thank you for the constructive feedback regarding Figure 2. As suggested, we  
199 have revised the figure to ensure readability.

200

201 Table 2 – fix table caption

202 **Reply:** Thank you for the suggestion. We have revised the caption for Table 2 to be  
203 more comprehensive in the revised manuscript.

204

205 Figure 3 – avoid using red (colour blind implications)

206 **Reply:** Thank you for the valuable suggestions. We have revised Figure 3 to avoid the  
207 use of red, ensuring that the plot is accessible to readers with colour vision  
208 deficiencies.

209

210 Sections 3.3.2, 3.3.3 and 3.3.4 – consider summarising all the data ranges in tables to  
211 avoid big text sections. You could potentially include these in the Appendices since  
212 you already include graphs.

213 **Reply:** We thank the reviewer for this helpful suggestion to improve the manuscript  
214 flow. As suggested, we have summarized this biochemical characterization and the  
215 percentages in Supplementary Table (S2) and streamlined the corresponding text  
216 (283-286, 292-294, 310-313) to improve the clarity of the Results section.

217

218

219 Line 351 – PCA analysis should be PCA

220 **Reply:** Thank you for pointing out this redundancy. We have corrected the text (Line  
221 351) in the revised manuscript to “PCA” instead of “PCA analysis.”

222

223 Section 4 Discussion – consider adding a short paragraph at the beginning that  
224 summarises all your key findings and then expand on the detail in the subsequent  
225 sections.

226 **Reply:** Thank you for this excellent suggestion. We have added a short paragraph  
227 (Line 368-378) in the revised manuscript.

228

229 The emphasis on Brandal as a biogeochemical hotspot is well supported by the data;  
230 however, a brief discussion on how representative this site may be of Arctic  
231 macroalgal beds more broadly, or which site characteristics may limit generalisation,  
232 would help place the findings in a wider Arctic context.

233 **Reply:** We thank the reviewer for this insightful suggestion. We have added a brief  
234 discussion (Line 552-558) in the revised manuscript addressing the representativeness  
235 of the brandal within Arctic macroalgal systems and the limitations associated with  
236 extrapolating these findings across the Arctic.

237

238 Figure 6 – add labels for 55 and 1500, add arrows with the label decreasing for the  
239 compounds/concentrations

240 **Reply:** Thank you for these specific suggestions to improve the clarity of our  
241 conceptual model in Figure 6. We have revised the figure as suggested to include the  
242 labels for 500m and 1500m sampling stations in bold text in the revised manuscript.  
243 Furthermore, we have added directional arrows to clearly illustrate the decreasing and  
244 increasing concentrations of key biochemical compounds as they are transported away  
245 from macroalgal beds.

246

247 Line 551 – missing full stop

248 **Reply:** Thank you for pointing out this redundancy. We have corrected the  
249 grammatical error in the revised manuscript.

250

251 Section 4.5 Implications – lines 538 – 548 is a summary of your results, consider  
252 moving this, along with Figure 6, to the start of your discussion. Expand on the  
253 implications sections so it focusses on the ‘so what does this mean for future research  
254 and climate/ecosystem implications’. The novelty of the study would benefit from  
255 being made more explicit, particularly in relation to previous POM studies in  
256 Kongsfjorden. A short clarification of what is fundamentally new here (e.g. molecular  
257 resolution, spatial design, or integration of proxies) would help situate the  
258 contribution more clearly within the existing literature.

259 **Reply:** We thank the reviewer for this strategic advice on the structure and impact of  
260 the discussion. We have reorganized the Discussion section by moving the summary-  
261 oriented content from Section 4.5, along with Figure 6, to the beginning of the  
262 Discussion to provide a clearer conceptual overview of the main findings. We have  
263 also substantially revised and expanded the implications section (Line 561-565) to  
264 focus more explicitly on the broader significance of our findings for future Arctic  
265 research and climate-driven ecosystem change. We have clarified the novelty and key  
266 advances of this study in relation to previous POM studies conducted in Kongsfjorden.
